

Food Safety Modernization Act and the Death of Paper Records

The Food Safety Modernization Act (FSMA) is a “last call” for those food and beverage companies that are still relying on paper based inventory, traceability, and HACCP (Hazard Analysis & Critical Control Points) records. Fortunately, Mobia Solutions makes it far easier and less expensive than ever before to implement a computer based solution that easily meets and exceeds the various new industry requirements, such as FSMA.

As is clear from the FSMA and many statements made since, the FDA is replacing their emphasis on plant inspections with validations of traceability and HACCP records. The records will be checked for accuracy, completeness, and speed of access. As our pharmaceutical customers know, the FDA excels at records inspection and reacting to failures.

While even well placed authorities have disagreed on sections of the law - there is no debate as to FDA’s strategic direction, goals, and preferences. There is also no debate as to whether paper based systems will allow companies to even meet the *current* functional requirements of FSMA, not to mention the regulations the FDA is now empowered to create. For all but the smallest and simplest food manufacturers and packagers - paper systems are known functional failures. Even small companies will find their paper records to be suspect by default.

Mobia offers an Internet based (cloud) or self hosted solution that provides everything you need to meet and exceed the FSMA requirements, and at a price you can afford. Mobia significantly lowers the cost and impact of installing a powerful, flexible, and easy to use electronic inventory, traceability, and HACCP solution. Since Mobia is designed to run standalone or integrated into your existing systems - you don’t have to disrupt your entire business to come into compliance.

The time to move to Mobia is now.
